| <b>Course objective</b>   | The course aims to present the basic methods for interpreting the behaviour of various types of materials in terms of their chemical compositions. Emphasis was placed on the application of chemical principles and their relationship to civil engineering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Course description</b> | <p>A- Cognitive objectives</p> <p>A1- Studying and knowing the types of cement, chemical properties and equations involved in its composition.</p> <p>A2- Study and knowledge of water, chemical properties and equations involved in its composition and water suitable for concrete mixture.</p> <p>A3- Study and knowledge of the types of lime and gypsum, chemical properties and equations involved in its composition.</p> <p>B – The skills objectives of the course.</p> <p>B1 – Application of chemical equations and for the purpose of knowing the chemical properties involved in structural engineering.</p> <p>B2 – Use basic knowledge to research new chemical techniques.</p> <p>B3 – Deriving and evaluating the equations necessary for the application of structural engineering analysis methods.</p> |
